Frequently asked questions

What is a fire risk assessment? −

A fire risk assessment identifies fire hazards, people at risk and the measures needed to control that risk. It considers both prevention — reducing the likelihood of a fire starting — and protection, including means of escape, fire detection, fire doors, emergency lighting and fire-safety management. Significant findings and required actions are recorded in the report.

Is a fire risk assessment a legal requirement? +

Who is responsible for arranging a fire risk assessment? +

What does a fire risk assessment look at? +

Who should carry out a fire risk assessment? +

What happens if the assessment identifies actions? +

Fire Risk Assessments for Residential & Commercial Premises

T&T Fire Safety carries out fire risk assessments for landlords, managing agents, businesses and organisations across England, Wales and Scotland.

The assessment considers the fire hazards, people at risk and fire-safety measures in place. Significant findings and required actions are recorded in the report.

What we assess

Fire hazards

Potential sources of ignition, combustible materials and other relevant fire hazards.

People at risk

Occupants, visitors and anyone who may require additional assistance in the event of fire.

Means of escape

Escape routes, final exits and the arrangements in place for evacuation.

Fire doors & compartmentation

Accessible fire-resisting doors, construction and compartmentation relevant to the assessment.

Fire detection & emergency lighting

The fire detection and alarm arrangements and emergency lighting provided.

Fire-safety management

Procedures, records, maintenance arrangements and other management controls.

Your fire risk assessment report

Significant findings

The fire risks and existing precautions identified during the assessment.

Prioritised actions

Recommended actions ranked according to priority.

Next steps

Guidance on the findings and any further action required.

Qualified fire risk assessors

Our fire risk assessment capability includes Intermediate and Advanced-level competence aligned with the BS 8674:2025 framework.

Assessments are undertaken by competent fire risk assessors with competency appropriate to the type and complexity of the premises.

Frequently asked questions

How long does an assessment take? −

It depends on the size, layout and use of the premises. A small single unit is often under an hour on site; a larger or more complex building takes longer. We confirm the expected duration when we quote.

Does the assessment include testing the alarm or emergency lighting? +

How often should the assessment be reviewed? +

What do you need from us before the visit? +

Do you need access to individual flats or units? +

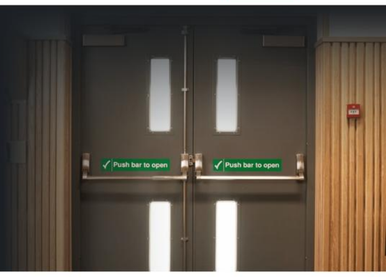

Do you carry out the remedial work identified? +

FIRE DOOR INSPECTIONS

Fire door inspections with door-by-door records, identified defects and recommended actions.

Get a Free Quote

Fire door inspections for residential & commercial premises

T&T Fire Safety inspects fire doors in residential and commercial premises, identifying defects in the door assembly, operation and condition that may affect fire performance.

Each inspected door is recorded with any defects and recommended actions.

What we inspect

Door leaf & frame

Condition, damage and general suitability of the door assembly.

Gaps & alignment

Gaps around the door and alignment within the frame.

Self-closing devices

Operation of the closer and the door's ability to close correctly.

Hinges & ironmongery

Condition and suitability of hinges, latches and other fitted hardware.

Intumescent strips & smoke seals

Presence, condition and continuity of fitted seals where required.

Glazing, apertures & signage

Condition of relevant glazing, openings, signage and available identification markings.

Your inspection report

Door condition

The condition and operation of each inspected door.

Identified defects

Defects recorded against each inspected door.

Recommended actions

Recommended remedial actions and their priority.

Routine checks & detailed inspections

Routine fire-door checks and detailed inspections serve different purposes. The appropriate scope depends on the building, the doors involved and the level of assessment required.

Frequently asked questions

How many doors do you inspect? −

The number is agreed before the visit. It may cover every fire door in the building or a defined sample, depending on the purpose of the inspection.

Is this the same as a fire risk assessment? +

Do you need access to flat entrance doors? +

Do you repair the defects you find? +

How is the report presented? +

Can the inspection be carried out in occupied buildings? +

FIRE ALARM SERVICING & INSTALLATION

Fire alarm servicing, installation and system alterations for residential and commercial premises.

Get a Free Quote

Servicing, installation & system alterations

T&T Fire Safety provides servicing, installation and alterations to fire detection and alarm systems in residential and commercial premises.

Existing systems can be inspected and serviced, while new systems and alterations can be scoped according to the building and fire-safety requirements.

Fire alarm servicing

Control & indicating equipment

Condition, indications, controls and recorded faults at the fire alarm panel.

Detection devices

Detectors and other system devices within the agreed service scope.

Manual call points

Condition and functional operation of manual alarm points.

Alarm devices

Sounders, visual alarm devices and other warning equipment where provided.

Power supplies

Primary and standby power arrangements relevant to the system.

System records

Service findings, recorded faults and relevant system documentation.

> Servicing and installation undertaken with reference to the applicable BS 5839 requirements.

Installation & upgrades

New installations

Fire detection and alarm systems for new or existing premises, based on the required system design and category.

Alterations & upgrades

Changes to existing systems where the building, layout or fire-safety requirements have changed.

Service records

Service findings

Faults and observations identified during the service visit.

Recommended remedial works

Recommended works where defects or system issues require attention.

Emergency Lighting Servicing & Installation

SERVICE PAGE · DESKTOP 1440

EMERGENCY LIGHTING SERVICING & INSTALLATION

Emergency-lighting testing, servicing and installation for residential and commercial premises.

Get a Free Quote

Testing, servicing & installation

T&T Fire Safety provides emergency-lighting testing, servicing, installation and upgrades for residential and commercial premises.

Testing checks the operation and condition of the emergency-lighting provision, with defects recorded for further attention where required.

Testing & servicing

Emergency luminaires

Condition and operation of emergency-lighting fittings.

Operation on supply failure

Confirmation that emergency lighting operates when the normal lighting supply fails.

Battery & charging condition

Charging indicators and battery performance within the agreed test scope.

Escape-route lighting

Emergency lighting provided along escape routes and at relevant changes of direction or level.

Exit signs

Illuminated and emergency exit signage where provided.

Records & defects

Test results and defects requiring further attention.

> Work undertaken with reference to the applicable requirements of BS 5266.

Installation & upgrades

New installations

Emergency-lighting installations for new premises or areas requiring additional provision.

Replacements & upgrades

Replacement or alteration of existing emergency-lighting equipment where required.

Test records

Test results and identified defects are recorded, with recommended remedial actions where required.

Servicing AOV & smoke-control systems

T&T Fire Safety provides servicing and functional testing of automatic opening vents and associated smoke-control systems.

The scope is agreed according to the installed system and the equipment requiring inspection and testing.

What we service

Automatic opening vents

Operation and condition of automatic opening vents and associated components.

Control equipment

Smoke-control panels, indications and recorded fault conditions.

Actuators

Operation of actuators and opening mechanisms.

Manual controls

Manual or firefighter controls where provided.

System interfaces

Relevant interfaces with fire detection or other control systems.

Power supplies

Primary and standby supplies associated with the smoke-control system.

Functional testing

01

Activation

Confirm the relevant activation arrangement operates.

02

Response

Check that vents and associated components respond as intended.

03

Reset & faults

Confirm reset operation and record faults requiring attention.

Service record

Service findings and identified faults are recorded, with remedial action recommended where required.

Frequently asked questions

What is an AOV?

An automatic opening vent is a vent — commonly a window, louvre or roof unit — that opens to release smoke from a stairway, lobby or corridor, so the escape route stays usable and firefighters can work in the building.

How often should an AOV system be serviced?

What does an AOV service include?

How is an AOV system activated?

What happens if the system fails a functional test?

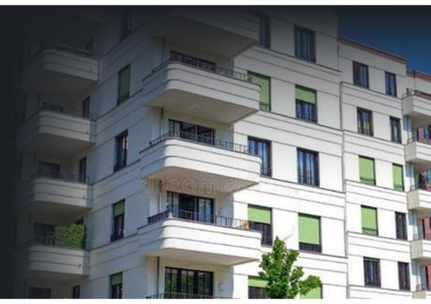

Do you need access to the roof or the head of the stair?

FIRE RISK ASSESSMENTS FOR BLOCKS OF FLATS

Fire risk assessments for purpose-built and converted blocks of flats.

Get a Free Quote

Fire Risk Assessments for Blocks of Flats

T&T Fire Safety carries out fire risk assessments for purpose-built and converted blocks of flats, supporting landlords, freeholders, managing agents and property managers.

The assessment considers the relevant fire risks, escape arrangements and fire-safety measures within the scope of the premises being assessed.

What we consider

Communal escape routes

Stairways, corridors, final exits and the routes residents use to leave the building.

Flat entrance doors

The role and condition of flat entrance doors where relevant and accessible to the assessment.

Communal fire doors

Fire-resisting doors protecting stairs, corridors, cupboards and other communal areas.

Compartmentation

Accessible elements of fire separation and any visible breaches or defects relevant to the assessment.

Fire detection & emergency lighting

Communal alarm and detection arrangements where provided, and emergency lighting to escape routes.

Fire-safety management

Signage, maintenance records, resident information and arrangements for managing fire safety.

Your fire risk assessment report

Significant findings

The fire risks and existing precautions identified during the assessment.

Prioritised actions

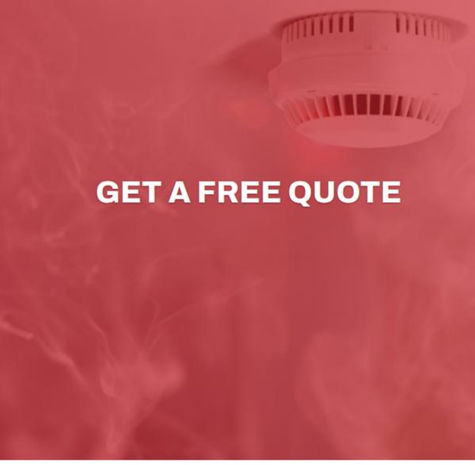

Recommended actions ranked according to priority.

Next steps

Guidance on the findings and any further action required.

Frequently asked questions

Does the assessment cover the inside of flats? −

A communal-areas assessment covers the shared parts and the elements separating them from the flats, including flat entrance doors where they are accessible from the communal side. Assessing inside flats is a wider scope, arranged separately.

Who is responsible for arranging it? +

Is the evacuation strategy considered? +

Do you open up construction to check compartmentation? +

What about buildings with a single staircase? +

How often should it be reviewed? +

© 2026 T&T Fire Safety. Company details to confirm.

BRAND EXTENSION — EXPLORATION

Corporate fire mark

One geometric direction, three refinements. The flame is drawn with straight edges and 45° shoulders on the same discipline as the T&T wordmark — a single angled lick on the left keeps it recognisable as fire without becoming an illustration. No shield, no extinguisher, no gradient, no outline weight to break up at small sizes.

Three refinements of one direction

A · Solid, contained

Flame reversed out of a solid red field. Strongest at small sizes — the field carries the colour when the form itself becomes too fine to read.

RECOMMENDED

B · Cored

The same silhouette with an inner core knocked back to red. More depth at display sizes; the core starts to close up below about 24px.

C · Open

The flame in red with no field, for use on white where a solid block would sit too heavily. Needs a light ground and clear space around it.

Wordmark integration

The mark replaces the existing hairline divider between T&T and FIRE SAFETY. It occupies the same optical width, so the lockup gets no wider or taller and the header height is unchanged.

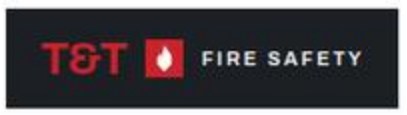

Current lockup

With mark A, on white

With mark A, reversed

Favicon & small sizes

Mark A holds at 16px because the red field does the work and the silhouette stays a single closed shape. The cored and open versions are display sizes only.

> Proposed for the wordmark, favicon and profile use only. It is deliberately not introduced as a section icon anywhere on the website — the existing wordmark stays in use as the fallback until this is approved.
